

real time, is this real time  
or am i just top standby  
watching ceiling lines  
studying blank signs  
downtime, is this downtime  
but we're fixing nothing  
just watching plate and fire  
that burn first touching  
annealing until flame's beyond concern  
revealing what's only fit to burn  
if this was all mine  
any test would be fine  
but flames just burn lines  
so all i want is to resign  
memory spit-bite wipe it clean  
but i need a solvent that's stronger  
what passes these lips is so binding  
drawing one to another
