Tom DeLonge

Our ability to understand things instantly, so called “common sense”, derives from a certain range of size and speed and duration that are appropriate for human existence. We know about things from a tenth of a millimeter to a few kilometers, from a fraction of a second to a lifetime. So when we are dealing with matters of quantum physics or particles tenth to the minus thirteenth centimeter or in cosmology where we are talking about 10 billion light years...

I can see your eyes
Electric light comes between things
Too close to paradise

I hear you say my name
[?] the stars at night
[?] ship
